

You are given a file name queries.txt (attached to the email) that consists of 5 queries to Github Code in the standardized Github format (more details about the API can be found here: [Github doc](#)).

Example queries:

- [sample query 1](#)
- [sample query 2](#)
- [sample query 3](#)
- [sample query 4](#)
- [sample query 5](#)

## Phase 1

Your task is to write code that: reads this file, executes the queries, and prints the results + a total number of results to the console.

- Can you estimate how much time it will take you?
- Before moving to phase 2, please talk with your interviewer and discuss the solution

## Phase 2:

How would your implementation change with having a parameter to control the parallelism level?

## Submitting:

1. Archive project directory (source, build scripts, whatever else seems appropriate) as ZIP.
2. Upload it to: [Easy Upload](#)
3. Send us the download link.

*Do not send email attachments because they might get filtered out on the way to our mailboxes!  
Do not make public repositories. Thank you!*
